Light therapies for acne (Review)

Jelena Barbaric (Croatia), Rachel Abbott (UK), Pawel Posadzki (Singapore),
Mate Car (UK), Laura H Gunn (USA), Alison M Layton (UK), Azeem Majeed
(UK), Josip Car (Singapore)

Annual Cochrane Skin Group Meeting 2017
Berlin, 10th January, 2017

Why was this review important?

A lot of public interest:

- One of the top research priorities among both clinicians and patients (Acne Priority Setting Partnership, AAD guidelines)
- Estimate of global market potential for anti-acne skin preparations USD 3300 million in 2013

Limitations of current treatments:

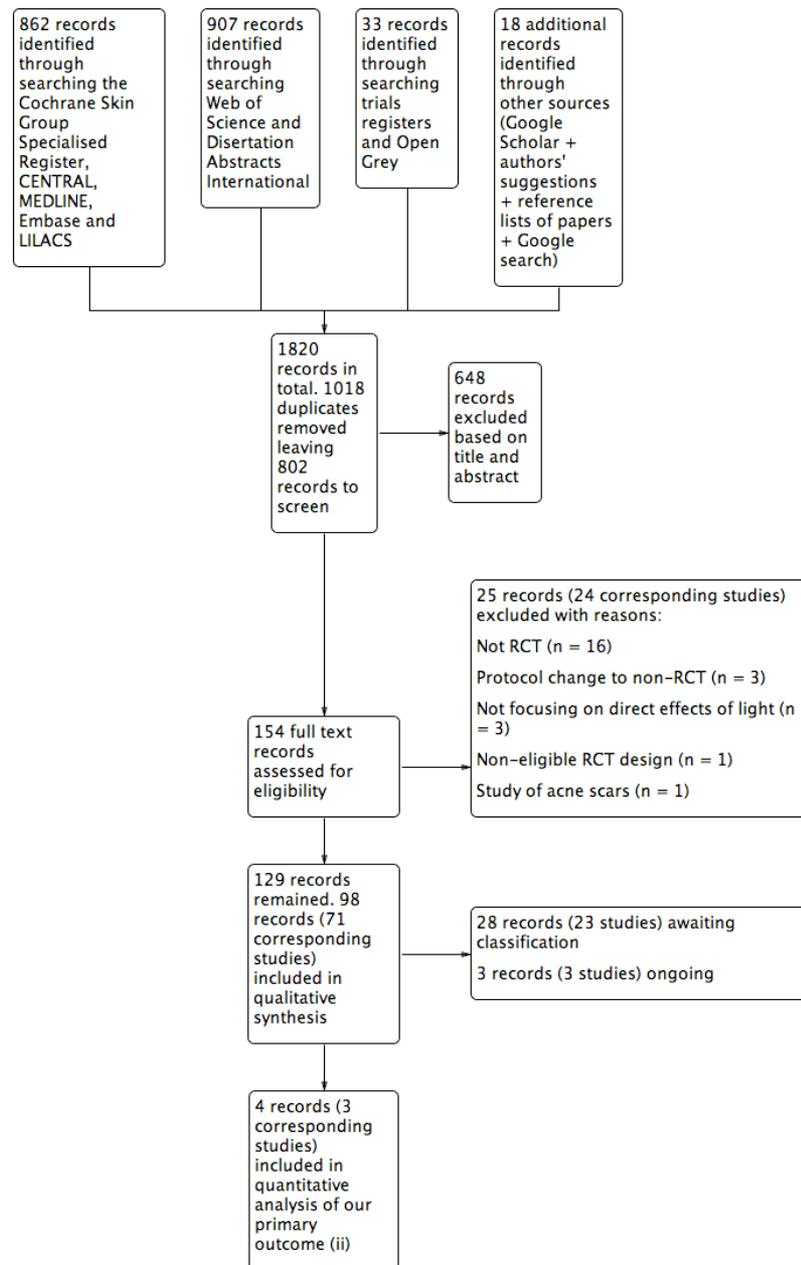

- Effectiveness, adverse effects, poor tolerability, inconvenience
- Increasing concerns around antibiotic-resistant bacteria

Evidence regarding efficacy not robust:

- Guidelines leave the recommendations open for most modalities, are not explicit, sometimes conflicting

What did this review find?

PRISMA Flow Chart

What did this review find?

Light therapies (including photodynamic therapy) for acne vulgaris		
<p>Patient or population: Mild, moderate and severe acne vulgaris Settings: Single and multicentre, worldwide Intervention: Light therapies including photodynamic therapy Comparison: Placebo, no treatment, topical treatment and other comparators</p>		
Outcomes	No of participants (studies)	Quality of the evidence (GRADE)
<p>Participant's global assessment of improvement Non-standardised scales Follow-up: up to 24 weeks after final treatment</p>	<p>1033 (23 studies)</p>	<p>⊕⊖⊖⊖ very low^{1,2,3}</p>
<p>Investigator-assessed change in lesion counts Lesion counts Follow-up: up to 12 months after final treatment</p>	<p>2242 (51 studies)</p>	<p>⊕⊖⊖⊖ very low^{1,2,3}</p>
<p>Investigator-assessed severe adverse effects Blistering or scarring Follow-up: up to 12 months after final treatment</p>	<p>3945 (66 studies)</p>	<p>⊕⊖⊖⊖ very low^{1,2,3}</p>

What did this review find?

Summary Risk of Bias

What did this review find?

Studies which included primary outcomes (i) and/or (ii),
by sample size and year of completion or publication

Size values illustrated by bubble area

Color of light intervention(s) illustrated by bubble fill

Bubble outline: full line indicates use of photosensitizer,

dotted line use of topical treatment in one of the interventions studied

Key findings

(i) Participant's global assessment of improvement

- 20% aminolevulinic acid (ALA)-PDT (blue light) vs vehicle plus blue light: little or no difference in effectiveness
- 20% ALA-PDT (red light) no more effective than 15%, but better than 10% and 5% ALA-PDT (red light)

(ii) Investigator-assessed changes in lesion counts

- 80 mg/g methyl aminolevulinate (MAL) PDT (red light) no different to placebo cream plus red light in change in inflamed lesions (ILs), percentage change in ILs, change in non-inflamed lesions (NILs), or in percentage change in NILs

Studies comparing the effects of other interventions inconsistent /small samples/high risk of bias > only narrative synthesis:

- Yellow light versus placebo or no treatment
- Infrared light versus no treatment
- Gold microparticle suspension versus vehicle plus light
- Clindamycin/benzoyl peroxide (C/BPO) plus PDL versus C/BPO alone

No clinically significant difference in effectiveness

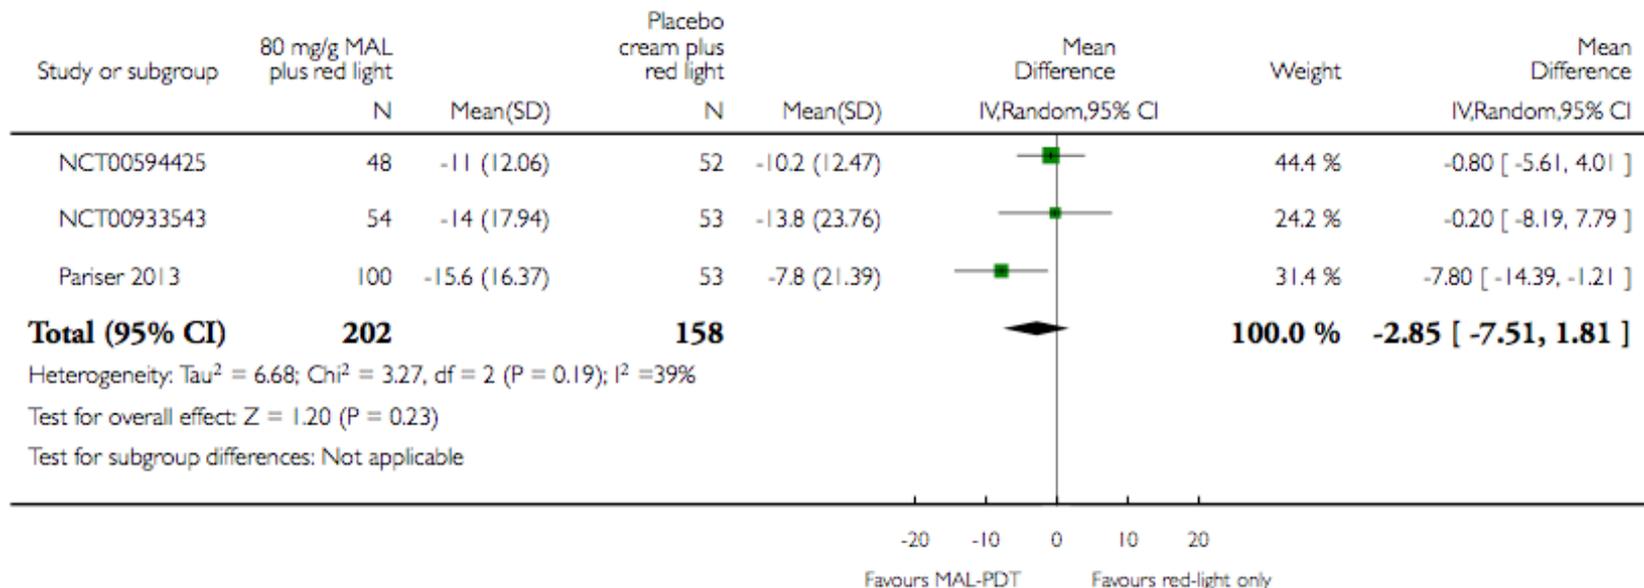

(iii) Investigator assessed severe adverse effects

- Scarring reported as absent, blistering only in studies on IPL, infrared light and PDT

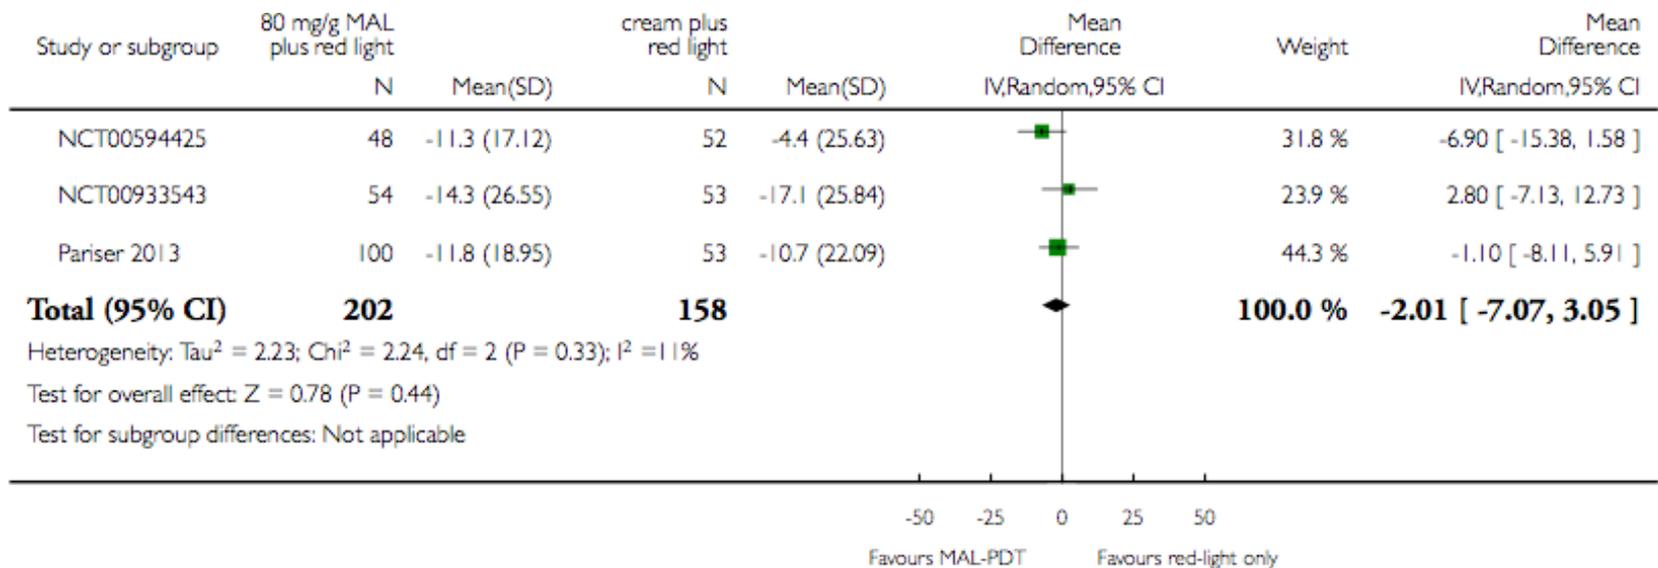

80 mg/g MAL + red light vs. placebo cream + red light at 6 weeks

Investigator-assessed change in:

Inflamed Lesions

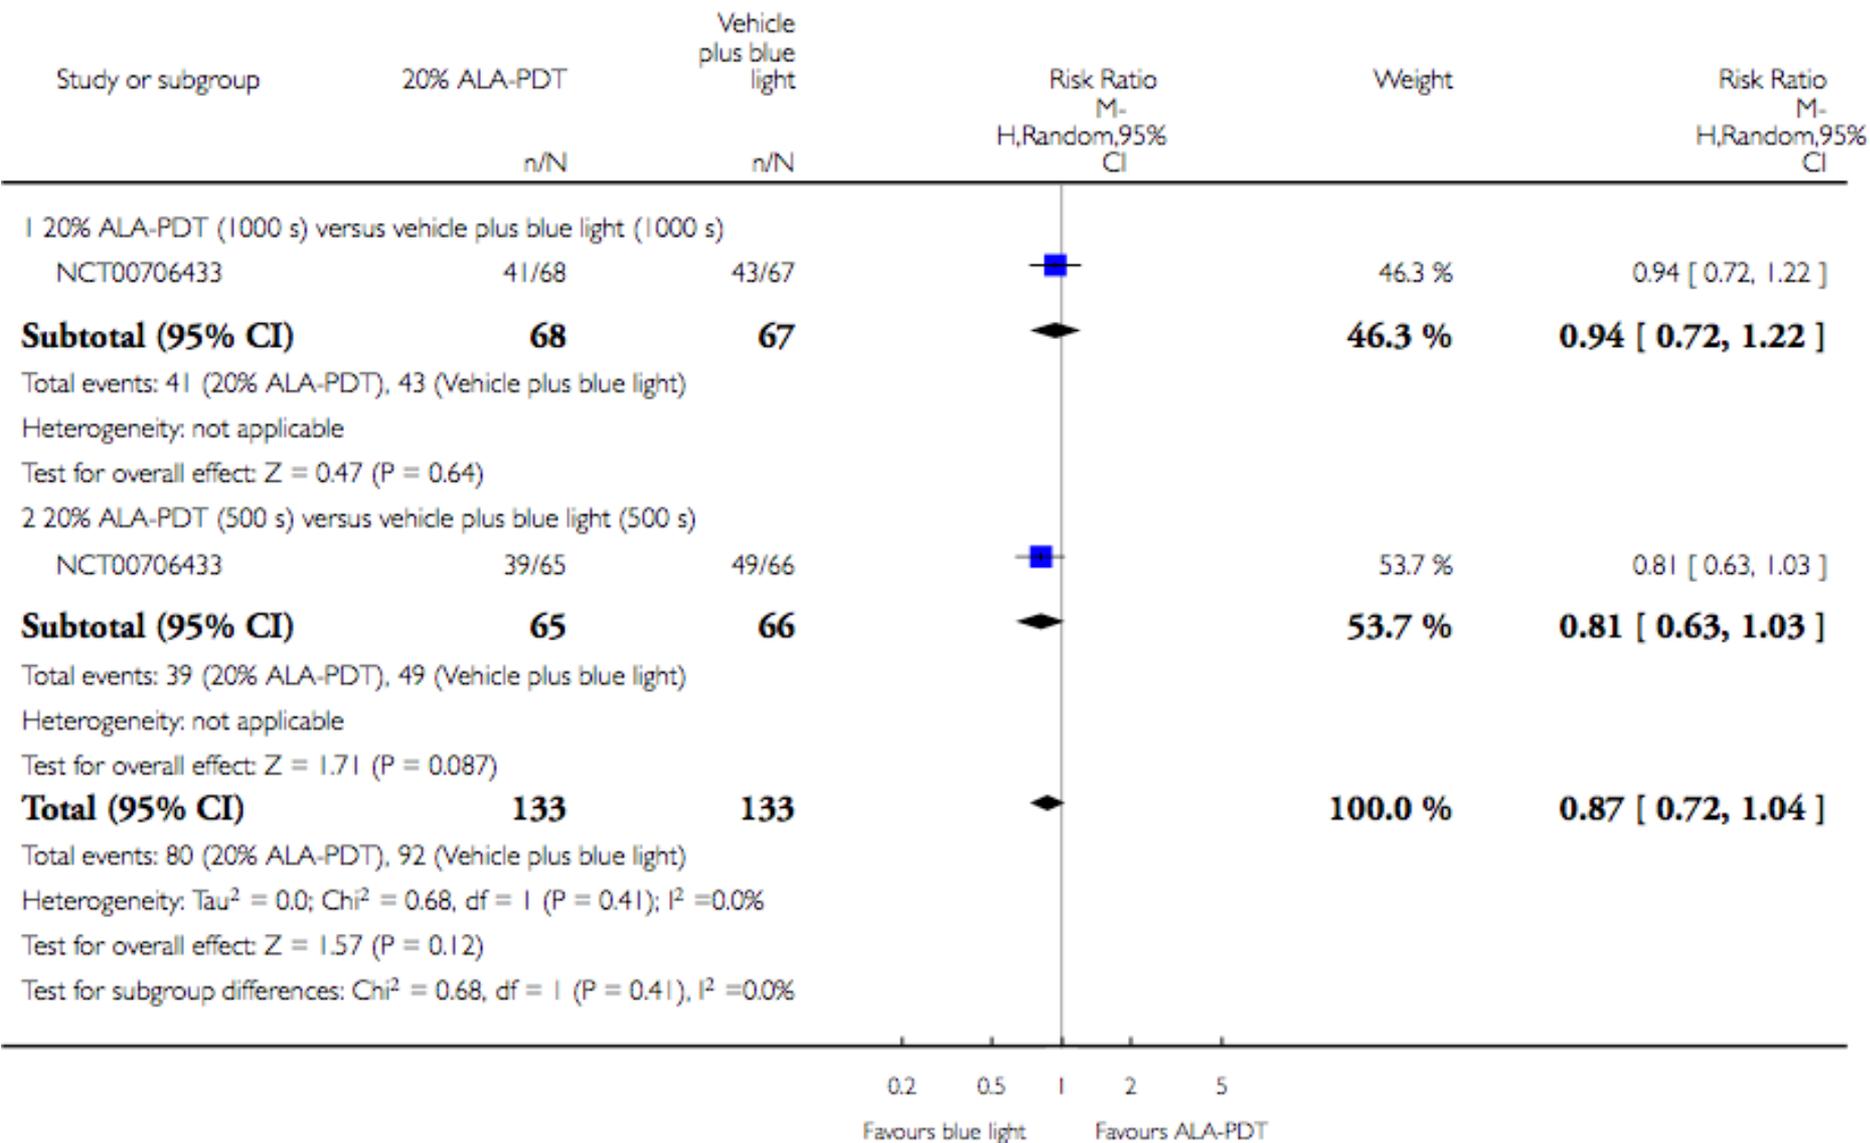

Non-Inflamed Lesions

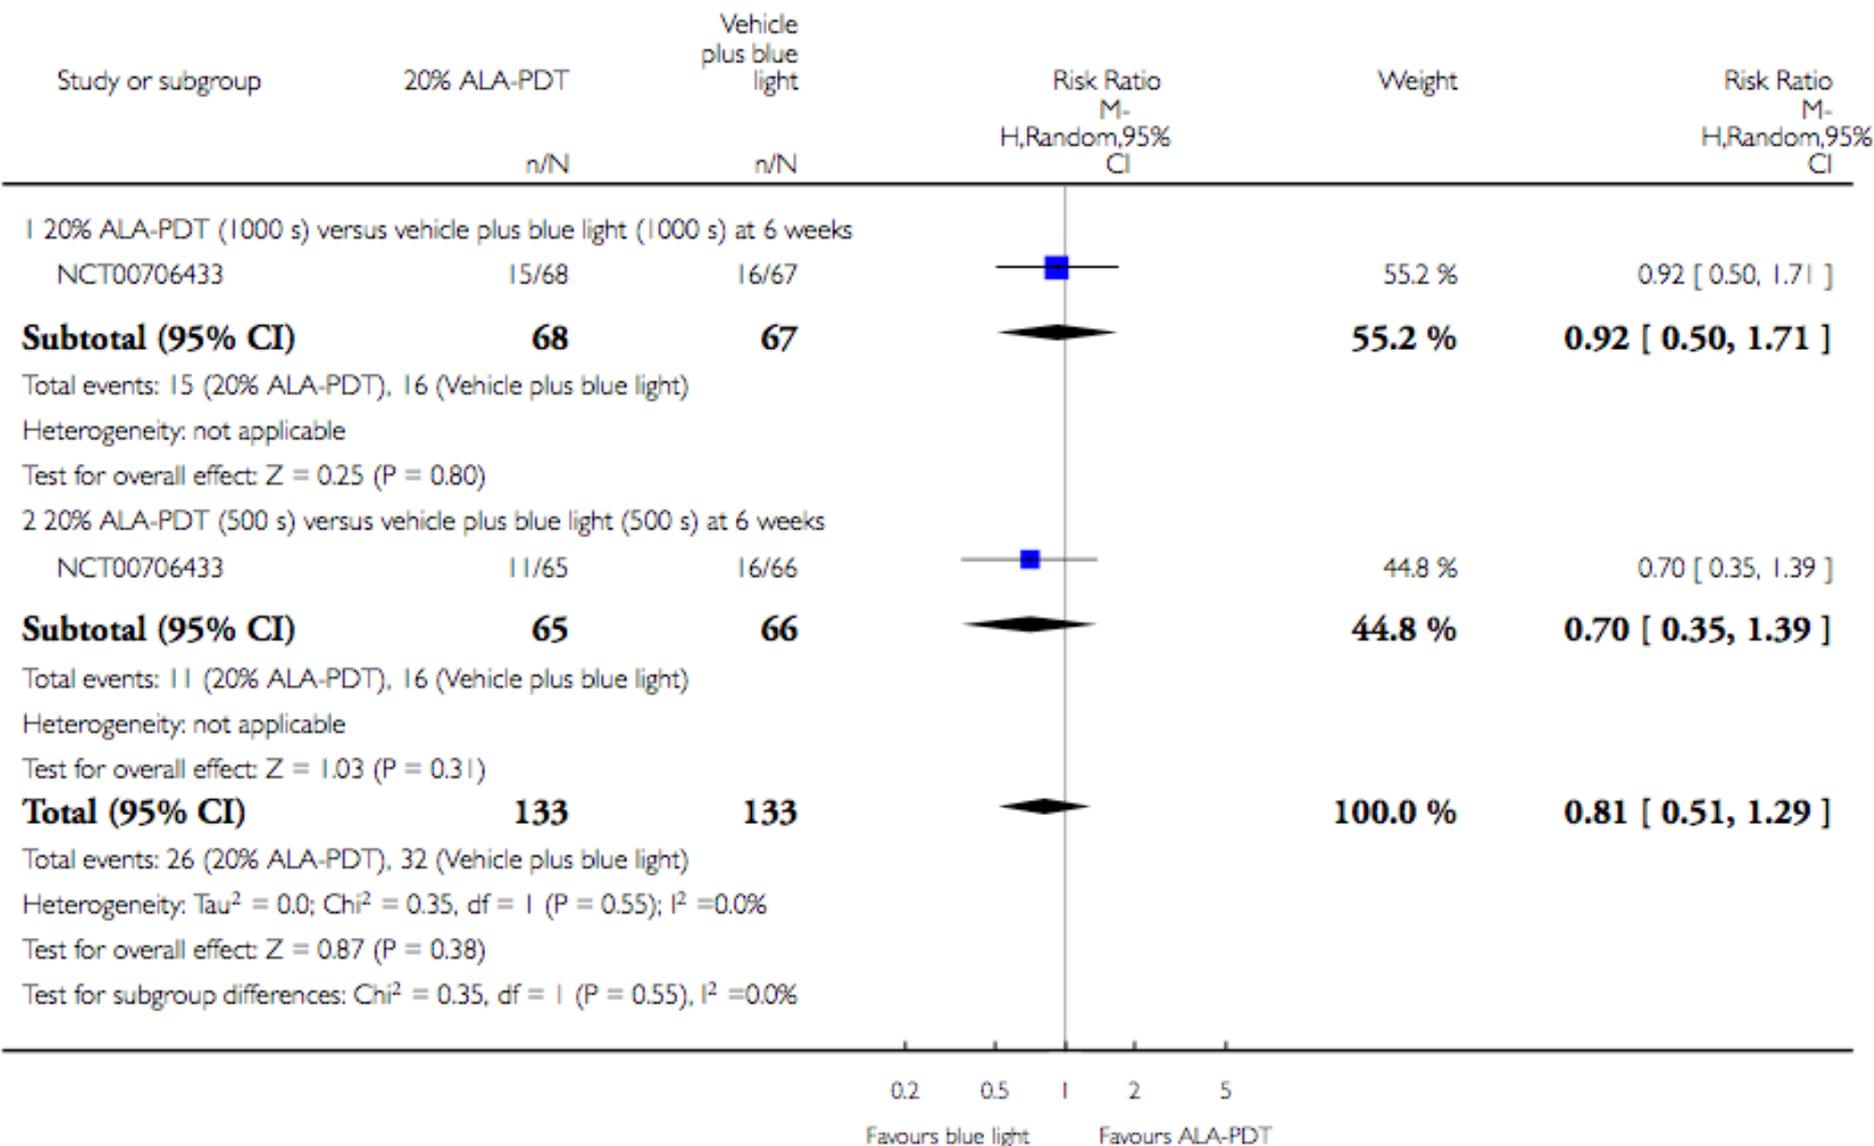

20% ALA + blue light vs vehicle + blue light at 6 weeks

Participant's global assessment of improvement

20% ALA + blue light vs vehicle + blue light at 6 weeks

Investigator's global assessment of improvement
